

Steps to set up Cluster

To set up Cluster you'll need to:

1. [Set up DFS Cluster](#) which moves binary files to NFS
2. [Configure Persistence Cache](#) to use Memcached or experimentally Redis
3. [Set up Varnish](#), disable Symfony HTTP Cache and set up cache invalidation to purge Varnish cache
4. [Configure sessions](#) to use a cluster safe sessions handling

It is also highly recommended to set up [Solr Bundle](#) to be able to get better search, better query performance, be able to scale it, and offload database.
