- [Validation](#)

Description

This Field Type makes it possible to store and retrieve an ISBN string in either an ISBN-10 or ISBN-13 format.

Value object

Properties

The Value class of this Field Type contains the following properties:

Property	Type	Description
<code>\$isbn</code>	<code>string</code>	This property will be used for the ISBN string.

String representation

An ISBN's string representation is the the `$isbn` property's value, as a string.

Constructor

The constructor for this value object will initialize a new Value object with the value provided. It accepts a string as argument and will set it to the `isbn` attribute.

Validation

The input passed into this Field Type is subject of ISBN validation depending on the Field settings in its `FieldDefinition` stored in the Content Type. An example of this Field setting is shown below and will control if input is validated as ISBN-13 or ISBN-10:

```
Array
(
    [isISBN13] => true
)
```

For more details on the Value object for this Field Type please refer to the [auto-generated documentation](#) (*todo: update link when available, see here for the value object and its doc in the mean time*).
