REST API reference

The complete reference (specification) of the REST API resources is found bundled with your software, or online:

REST API reference
Path to where you can find specification of the version you have:

```
vendor/ezsystems/ezpublish-kernel/doc/specifications/rest/REST-AP
I-V2.rst
```

Online version for latest version:

```
https://github.com/ezsystems/ezpublish-kernel/blob/master/doc/spe
cifications/rest/REST-API-V2.rst
```

About the REST specification structure

Resources are grouped by chapters: Content, Content Types and User. In each of those chapters, you will first get an overview, with a table crossing every resource with every applicable HTTP verb, and giving you a summary of the action.

Then throughout the chapter, grouped into sub-chapters, is the detailed documentation for every resource, with:

- The resource string
- The HTTP verb with override, if applicable
- A description of what this resource does
- Which headers are supported, and how to use them
- Which error codes can occur
- Most of the time, a request + response example
